

# Department of Electrical and Computer Engineering

## Electric Power and Power Electronics Institute

---

3-Day Short Course

### **ENERGY MANAGEMENT SYSTEM FUNCTIONS**

Prof. A. Abur and Prof. G. Huang  
Department of Electrical and Computer Engineering, Texas A&M University

#### **Contents**

##### **SECTION I. Introduction**

- Power system monitoring
- Power system control
- Power system economics
- Security assessment

##### **SECTION II. Network equations**

- Network modeling
- Solution of network equations

##### **SECTION III. State estimation**

- Weighted Least Squares (WLS) estimation
- Network observability
- Bad Data processing
- Use of ampere measurements
- Robust estimators
- Parameter estimation
- Topology errors

##### **SECTION IV. Security analysis**

- Basic concepts
- Contingency ranking
- Numerical issues

##### **SECTION V. Economic dispatch and price-based dispatch**

- Basic concepts
- Production cost curving
- Minimization formulations
- Classical economic dispatch
- Price based dispatch

##### **SECTION VI. Automatic generation control**

- Fundamental principles

- Load mismatch estimation
- Price based AGC
- Coupling with economic dispatch

#### **SECTION VII. Optimal power flow**

- Problem formulation
- Its application to economic dispatch
- Its application to pricing

#### **SECTION VIII. Transient stability analysis**

- Modeling issues
- Equilibrium points
- Two area criteria for simple systems
- Two area criteria for big systems
- Stability margins
- Stabilizing controls
- Real time control issues

#### **SECTION IX. Voltage stability and margin**

- Modeling issues
- Loading levels and voltage stability
- Simple systems for insights
- Voltage collapse in large systems
- Voltage stability margins
