

Department of Electrical and Computer Engineering Electric Power and Power Electronics Institute

Short Course

MATLAB FOR POWER ENGINEERS

Prof. G. Huang, Prof. A. Abur, and Prof. M. Kezunovic
Department of Electrical and Computer Engineering, Texas A&M University

Contents

SECTION I. Introduction

- General solvers for engineers
- MATLAB capabilities
- Programming in MATLAB

SECTION II. GUI development

- Basic concepts and definitions
- Steps of development
- Illustrative examples

SECTION III. Sparse matrix methods

- Manipulation of sparse matrices in MATLAB
- Visualization of sparse matrices
- Library of functions

SECTION IV. Demonstrating examples: Network applications

- Power balance equations
- Numerical techniques for solving nonlinear equations
- Solution of network equations
- Flow chart and implementation for power flow analysis

SECTION V. Demonstrating examples: Transient stability analysis

- Modeling issues
- Equilibrium point calculations
- Trajectory calculations
- Two area criteria for simple systems
- Two area criteria for big systems
- Stability margins and calculations
- Incorporating stabilizing controls into trajectory calculations

SECTION VI. Demonstrating examples: Voltage stability and margin

- Modeling issues
- Loading levels and voltage stability
- Simple systems and calculation examples for insights

SECTION VII. Demonstrating examples: Fault analysis and relay settings

- Modeling of faults
- Modeling of relays
- Evaluation of relay operation using fault transients
- Evaluation of relay design using phasors

SECTION VIII. Conclusions

- Future extensions of existing MATLAB libraries
- Building your own applications based on the examples presented in the course
